Chapter 1: Cell Injury, Cell Death, and Adaptations

Professor's Name

April 7, 2024

Outline

- 1 Introduction
- 2 Necrosis
- 3 Apoptosis
- 4 Cellular Adaptations
- 5 Intracellular Accumulations
- 6 Summary

Introduction

Introduction

- Understanding cell injury, death, and adaptations is crucial for diagnosing and treating diseases.
- This chapter explores the mechanisms and implications of these cellular processes.

Necrosis

Necrosis

- Necrosis is a form of cell death characterized by cell membrane breakdown, organelle swelling, and rupture.
- It leads to inflammation in surrounding tissue.

Causes of Necrosis

Caused by external factors like toxins, infections, or trauma.

Types of Necrosis

Types include coagulative, liquefactive, caseous, and fat necrosis.

Example of Necrosis

Example: Coagulative necrosis often occurs in the heart after a myocardial infarction, where lack of oxygen leads to cell death.

Apoptosis

Apoptosis

- Apoptosis is programmed cell death, crucial for removing damaged or unnecessary cells.
- Characterized by cell shrinkage, chromatin condensation, and apoptotic bodies formation.

Characteristics of Apoptosis

Does not initiate inflammation.

Example of Apoptosis

Example: The elimination of webbing between fetal fingers and toes is a natural occurrence of apoptosis.

Cellular Adaptations

Cellular Adaptations

Adaptations include changes in size (atrophy, hypertrophy), number (hyperplasia), form (metaplasia), and function.

Types of Adaptations

- Atrophy: Decrease in cell size or number, e.g., in unused muscles.
- Hypertrophy: Increase in cell size, e.g., in heart muscle due to hypertension.

More on Adaptations

Metaplasia: Change of one cell type to another, e.g., in the respiratory tract of smokers.

Example of Adaptation

Example: Hyperplasia occurs in the endometrium during the menstrual cycle, preparing for potential pregnancy.

Intracellular Accumulations

Intracellular Accumulations

- Buildup of substances cells can't use or dispose of.
- Examples include lipids in liver cells, proteins in kidney tubule cells, and pigments like lipofuscin.

Example of Intracellular Accumulations

Example: Fatty liver disease results from the accumulation of lipids in liver cells, often due to alcohol abuse or obesity.

Summary

Summary

- This chapter covered the fundamental concepts of cell injury, death, and adaptations.
- Understanding these processes is essential for diagnosing and managing diseases.
- We explored necrosis, apoptosis, cellular adaptations, and intracellular accumulations.
