Chapter 1: Cell Injury, Cell Death, and Adaptations

Professor's Name

April 7, 2024

Outline

- Introduction
- Necrosis
- 3 Apoptosis
- 4 Cellular Adaptations
- 5 Intracellular Accumulations
- **6** Summary

•0

Introduction

Introduction

0

- Understanding cell injury, death, and adaptations is crucial for diagnosing and treating diseases.
- This chapter explores the mechanisms and implications of these cellular processes.

Necrosis

roduction Necrosis Apoptosis Cellular Adaptations Intracellular Accumulations Summary 0000 0000 0000 000

Necrosis

- Necrosis is a form of cell death characterized by cell membrane breakdown, organelle swelling, and rupture.
- It leads to inflammation in surrounding tissue.

Necrosis 00000

Causes of Necrosis

• Caused by external factors like toxins, infections, or trauma.

roduction Necrosis Apoptosis Cellular Adaptations Intracellular Accumulations Summar 000 ● 0 0000 0000 0000 0000

Types of Necrosis

■ Types include coagulative, liquefactive, caseous, and fat necrosis.

oduction Necrosis Apoptosis Cellular Adaptations Intracellular Accumulations Summary 0000 0000 0000 000

Example of Necrosis

Example: Coagulative necrosis often occurs in the heart after a myocardial infarction, where lack of oxygen leads to cell death.

9/24

Apoptosis

Apoptosis 0.00

Apoptosis

- Apoptosis is programmed cell death, crucial for removing damaged or unnecessary cells.
- Characterized by cell shrinkage, chromatin condensation, and apoptotic bodies formation.

Characteristics of Apoptosis

Does not initiate inflammation.

12 / 24

roduction Necrosis Apoptosis Cellular Adaptations Intracellular Accumulations Summary 0000 000 0000 0000 000

Example of Apoptosis

Example: The elimination of webbing between fetal fingers and toes is a natural occurrence of apoptosis.

Cellular Adaptations

Professor's Name

roduction Necrosis Apoptosis **Cellular Adaptations** Intracellular Accumulations Summary 0000 0000 0000 0000 000

Cellular Adaptations

Adaptations include changes in size (atrophy, hypertrophy), number (hyperplasia), form (metaplasia), and function.

Types of Adaptations

- Atrophy: Decrease in cell size or number, e.g., in unused muscles.
- Hypertrophy: Increase in cell size, e.g., in heart muscle due to hypertension.

n Necrosis Apoptosis **Cellular Adaptations** Intracellular Accumulations Summ 0000 0000 000 000 000

More on Adaptations

Metaplasia: Change of one cell type to another, e.g., in the respiratory tract of smokers.

Example of Adaptation

Example: Hyperplasia occurs in the endometrium during the menstrual cycle, preparing for potential pregnancy.

Intracellular Accumulations

Intracellular Accumulations

Intracellular Accumulations

- Buildup of substances cells can't use or dispose of.
- Examples include lipids in liver cells, proteins in kidney tubule cells, and pigments like lipofuscin.

roduction Necrosis Apoptosis Cellular Adaptations Intracellular Accumulations Summary

Example of Intracellular Accumulations

Example: Fatty liver disease results from the accumulation of lipids in liver cells, often due to alcohol abuse or obesity.

ntroduction Necrosis Apoptosis Cellular Adaptations Intracellular Accumulations Summary

Summary

Summary

Summary

- This chapter covered the fundamental concepts of cell injury, death, and adaptations.
- Understanding these processes is essential for diagnosing and managing diseases.
- We explored necrosis, apoptosis, cellular adaptations, and intracellular accumulations.
